

How can testing contribute to sustainability in the medical technology and pharmaceutical industry?

Jochen Niederberger, ZwickRoell GmbH & Co. KG

Abstract:

Sustainability is one of the megatrends of our time and affects us in all situations. For the medical technology and pharmaceutical industry sustainability is becoming a very pressing issue – especially due to uncertain supply chains and the massive increase in the cost of energy and gas as well as the pressure from society. Companies are therefore paying increasing attention to energy efficiency, reducing emissions and the reusability of their products, as well as minimizing pollutants and waste.

Testing plays not only a minor role in achieving their sustainability goals up to now. However, there is great potential in the testing process, the testing system and the integration in the product life cycle. This presentation will provide impulses and starting points on how testing can contribute to the achievement of your sustainability goals.
