testXpert R Fracture Mechanics Testing Software for Determination of J1C and CTOD Fracture Toughness acc. to ISO 12135

Specimen with bolt-on knife edges and crack-opening displacement extensometer

testXpert Research fracture mechanics testing software is used for the determination of J1C and crack tip opening displacement CTOD (δ) fracture toughness according to ISO 12135:2021 using the single-specimen method (resistance curve procedure), which is ideally suited for C(T) and SE(B) specimens.

Depending on the material behavior, different approaches are used in fracture mechanics. Elastic-plastic fracture mechanics describes the failure of ductile materials. Crack-tip parameters J and δ characterize elastic-plastic loading. When critical values are reached, they result in crack initiation and stable crack growth.

The test consists of three basic parts:

1. In the first part, the specimen is prepared by generating the fatigue crack. This is referred to as precracking.

2. The second part is the actual test, in which primarily force and displacement or strain values are recorded,

Specimen with offset notch

allowing provisional fracture-toughness values of the material to be determined.

3. During the third part, the values obtained in the test are studied and corrected or refined through subsequent evaluation until eventually a definitive fracture-toughness value is determined for the material.

The test is implemented using testXpert Research in accordance with ISO 12135 as follows:

- Specimen pre-cracking over a constant load level or two steps according to 5.4.2.4
- Estimation of the initial crack length via compliance calculation according to section 7.2.3
- Performance of the tensile test with configurable partial unloading according to section 7.2.3
- \bullet Display and evaluation of the J-R curve as well as the $\delta\text{-R}$ curve
- Qualification of the results via validity criteria according to section 8.7 8.10

testXpert R Fracture Mechanics Testing Software for Determination of J1C and CTOD Fracture Toughness acc. to ISO 12135

CTA: 300032 300034

Results determined in the J-integral layout:

- Δa_.: Array with crack-growth values (crack length)
- J_{elast}: Array consisting of elastic parts of the J-values (J-integral)
- J_{plast.}: Array consisting of plastic parts of the J-values (J-Integral)
- J_{max}: Maximum J-integral capacity
- J_{limit}: Limited J-integral capacity
- $\Delta a_{min, J}$: Intersection of 0.15 mm exclusion line with J- Δa curve
- $\Delta_{aLimit J}$: Intersection of 1.5 mm exclusion line with J- Δa curve
- J_Q : Intersection of 0.2 mm offset line with J- Δa curve
- J_{Ic}: Critical J-value for crack length initiation and stable crack growth
- \bullet K_{JQ}/K $_{JIC}:$ Stress intensity at J_Q/ J_{Ic}

In the diagram:

- J-R curve
- Exclusion lines with $2^*\sigma$ gradient
 - 0 mm construction line
 - 0.15 mm exclusion line
 - 0.2 mm offset line
 - 1.5 mm exclusion line

Results determined in crack tip opening layout $\boldsymbol{\delta}$:

- Δa_{δ} : Array with crack-growth values (crack length)
- δ: Array of δ-values
- δ_{max}: Maximum crack tip opening
- δ_{limit}: Limited crack tip opening
- $\Delta a_{min, \ \delta}$: Intersection of 0.15 mm exclusion line with δ - Δa curve
- $\Delta a_{\text{limit }\delta}$: Intersection of 1.5 mm exclusion line with δ - Δa curve
- δ_Q : Intersection of 0.2 mm offset line with δ -Da curve
- δ_{Ic} : Critical $\delta\text{-}$ value for crack initiation and stable crack growth

In the diagram:

- δ-R curve
- Exclusion lines with $2^*\sigma$ gradient
- 0 mm construction line
- 0.15 mm exclusion line
- 0.2 mm offset line
- 1.5 mm exclusion line

test pert[®]R Zwick Roel

During the test, test data can be observed in an online graph.

A status display shows which block is currently being processed.

The PID settings of the controller, the parameters of the test sequence, and the results are saved together in one file, making this information easily accessible at any time.

All testXpert R test programs are workflow-based and aligned with real workflow processes in the lab. This setup guides the user through the test with logical and traceable steps:

- 1. Set up testing system
- 2. Set up controller
- 3. Configure test
- 4. Run test
- 5. View results

This structure, as well as the software interface are almost identical to our testXpert III software for static tests. Training requirements are therefore minimized and laboratory personnel are ready to operate diverse ZwickRoell machine types in a short time.

Description	ArticleNumber
testXpert R test program according to ISO 12135	3012441
testXpert R Metals industry package – Fracture mechanics includes master test programs for performing the following tests: • ASTM E399 (K1C) • ASTM E647 (da/dN)	1118638

- ASTM E1820 (J1C, CTOD)
- ISO 12135 (J1C, CTOD)
